

Operating instructions for the 1800B Badge-a-matic and 2000 Cut-a-circle

Step 1 - Use the 2000 Cut-a-circle to cut out your prepared artwork, photograph or magazine picture like so. Use the palm of your hand to rotate handle and always use the cutting board provide to protect your work surface.

Step 2 - Place the plastic pin back in the bottom of the die-set with the clasp side down, make sure the pin is located in the "East-West" position.

Load the rest of the components in the following order: Badge front facing up (edges down, curved face up), artwork and finally mylar clear plastic.

Step 3 - Pull the handle down until the top die engages with the bottom die. Gently release the handle to the upright position and you will notice that everything but the badge back has transferred to the top die. This is normal.

Step 4 - This step is most important.

With the tips of your fingers (both hands), push the front of your badge right up into the top die. You will feel a soft "plop" as the components move into position.

Very little pressure is needed but make sure you use even right and left pressure.

Step 5 - Note the slide bar under the bottom die and push it in.

Pull down on the handle to the limit of it's travel. You'll feel some resistance as the badge is crimped.

Gently release the handle.

Your badge is now complete and ready to eject.

Step 6 - Using the ejector pin on the right hand side of the bottom die, push up to eject the completed badge.
